ABOUT THE COVER

Intracerebral xenograft initiated from the CD133+ glioblastoma stem-like cell line GBMJ1. At the initial signs of morbidity (94 days after implantation) a representative mouse was euthanized and the brain tumor prepared for histological analyses. This figure shows the immunofluorescent analyses of GFAP (red) and III tubulin (green) with nuclei counterstained with DAPI (blue) at 20x magnification. For details, see the article by Jamal and colleagues on page 6049 of this issue.
