6519  ABOUT THE COVER

Expression of GFP-tagged PROX1 in colon cancer cells reduced E-cadherin and induced epithelial–mesenchymal transition. We found that PROX1 activated miR-9 expression to attenuate E-cadherin protein posttranscriptionally. Results of this study provide a molecular basis by which PROX1 promotes tumorigenesis of colon cancer. For details, see the article by Lu and colleagues on page 6416 of this issue.
