ABOUT THE COVER

Assembling of microRNA-loaded transferrin-conjugated-nanoparticles to target acute myeloid leukemia (AML) blasts. The nanoparticle core was composed of negatively charged microRNA molecules (miR, ➕) and positively charged polyethylenimine (PEI, ➖). Empty nanoparticles were composed of DOPE (❖), linoleic acid (►), and DMG-PEG (▼). After the loading of the PEI-miR core in the nanoparticles, transferrin-PEG-DSPE (▪) was inserted into the nanoparticle surface for specific targeting of leukemia blasts. The background depicts a cytospin of AML blasts derived from a mouse with AML treated with miR-loaded nanoparticles. For details, see the article by Huang and colleagues on page 2355 of this issue.
