About the Cover
The cover shows a section of an intracranial glioblastoma (GBM). GBM cells express the fluorescent protein citrine (green) and the high-mobility group protein B1 (HMGB1) fused to the red fluorescent protein cherry. In living cells HMGB1 is located in the nucleus; upon cell death, HMGB1 is translocated to the cytoplasm and is eventually secreted. Circulating levels of HMGB1 may constitute a noninvasive surrogate biomarker of therapeutic efficacy. For details, see the article by Candolfi and colleagues on page 1555 of this issue.
