Supplemental Figure 1. *Duration of tumor shrinkage in each treatment group.* The boxplots represent the durations of tumor shrinkage within each group. Tumor shrinkage is defined as the amount of time each tumor was at or below half its original volume. The top, midline, and bottom of the boxes indicate the 75th percentile, median, and 25th percentile, respectively, with the median duration also indicated numerically above the boxplot for each treatment group. The whiskers show the most extreme non-outlier data points, while dots indicate outliers. The p-values of Wilcoxon tests of equality between treatment groups are displayed below the corresponding boxes.
