adherent cells

Interaction of NHL cells with BMSCs.
NHL cell lines BL-2, BJAB and Raji (2x10^5/ml) were co-incubated with pre-established monolayer of BMSCs for 24 hours. (A) Non-adherent cells were removed and NHL-stroma co-cultures were evaluated by microscope for stromal incorporation and cobblestone formation. Representative pictures are displayed, magnification x20. (B) CXCR4 expression in BL-2 cells treated with rituximab, in the absence or presence of BMSC.
