Figure Legend

Supplemental Figure 1: Steady State Plasma Pharmacokinetics of Vandetanib (100 mg/m²/dose) in Children (age <13 years) and Adolescents (age ≥13 years). The average± standard deviation concentration of vandetanib is plotted for each time point. Pharmacokinetic samples were collected after cycle 2 in children and adolescents receiving 100 mg/m²/d. Analysis of the plasma concentrations of vandetanib for the first 3 subjects on the trial (adolescents) was performed beyond the documented 6 month stability range. Additional stability testing is ongoing.
