Supplementary Fig. 3. IL-2 intracellular staining of EBV-CTLs stimulated with autologous EBV-LCLs. IL7Rα.CAR-GD2 CTLs were stimulated with EBV-LCLs (ratio 1:1 or 1:2) and then 2 hours later we detected the production of IL-2 by intracellular staining and FACS analysis. CTLs without antigen stimulation and PMA/Ionomycin and Staphylococcus Exotoxin were used as negative and positive controls, respectively.
