Supplementary Figure Legends

Figure S1. Comparative quantification of circulating miRNA

(A-F) Relative miRNA levels of all pre-therapy patients with cHL compared to healthy controls. Error bars represent mean with SEM. (G-J). Relative miRNA levels of pre-therapy versus post-therapy in patients who achieved CR post-therapy. Lines identify paired samples.

Figure S2. Pre-therapy versus healthy controls absolute quantification of circulating miRNA

Results are reported by absolute quantification as copies/ul of plasma. Error bars represent mean with SEM. (A-D) Plasma miRNA levels of all pre-therapy patients with cHL compared to healthy controls.

Figure S3. Circulating miRNA are not significantly influenced by time from collection to processing

Results are reported by absolute quantification as copies/ul of plasma. Grey squares represent the healthy control sample; black circles represent the interim therapy cHL patient sample. Plasma was collected from the blood sample at specified time-points, reported as hours from venipuncture.
