Supplementary Figure S3. In contrast to LacNAc, GM-CT-01 does not detach galectin-1 and galectin-3 from melanoma cell surface. MZ2-MEL.43 tumor cells were incubated at 37°C for 2 h with LacNAc or GM-CT-01, washed and incubated with 5 μg/ml of either anti-galectin-3 antibody (M3/38, rat IgG2a, Biolegend) or polyclonal anti-galectin-1 rabbit IgG (Abcam). Cells were further incubated at 4°C for 15 min, washed and incubated at 4°C for 15 min with relevant anti-Ig secondary antibodies coupled to Alexa 488 (Invitrogen).
