Correction

Article on High-Dose Interleukin-2 in Patients with Advanced Melanoma and Renal Cell Cancer.....	3433
---	------

About the Cover

The effects of curcumin on NF- κ B (*top row*), phospho-STAT3 (*middle row*), and COX-2 (*bottom row*) expression were examined in an orthotopic mouse model of ovarian carcinoma. Compared with controls (*left column*), treatment with oral curcumin (500 mg/kg) decreased expression of NF- κ B (p65), phospho-STAT3, and COX-2 as early as 24 hours after the last dose (*middle column*). Expression of these three factors returned to baseline levels by 72 hours after treatment (*right column*). The potent inhibition of these critical tumorigenic and angiogenic factors evidenced here support the development of curcumin-based therapeutic strategies for ovarian carcinoma. For further details, please see Lin *et al.* on page 3423 in this issue.
