About the Cover

In this first preclinical study, synthetic polymeric vectors based on pseudodendritic oligoamines were used for tumor-specific delivery of the sodium iodide symporter (*NIS*) gene after systemic delivery, resulting in a significant therapeutic effect of radioiodine in a neuroblastoma mouse model. The figure shows immunofluorescence analysis using a Ki67-specific antibody (*green*) and an antibody against CD31 (*red, labeling blood vessels*) revealing high proliferation and blood vessel density in control tumors in contrast to *NIS*-transduced tumors after radioiodine treatment. For further details, please see Klutz and coworkers on page 6079 in this issue.
