## ABOUT THE COVER

Targeting Cdk-2 in lung cancer was found to engage a previously unrecognized mechanism: induced anaphase catastrophe. This triggers apoptosis in lung cancer cells. The immunofluorescent image of a representative lung cancer cell is shown following small interfering RNA targeting of Cdk-2. In this image, microtubules are displayed in red and DNA in blue within a multipolar lung cancer cell undergoing anaphase catastrophe. For further details, please see the article by Galimberti and colleagues on page 109 of this issue.
