## ABOUT THE COVER

The cover shows a section of a biopsy specimen from a patient with T790M-positive EGFR-mutated NSCLC post resistance to EGFR TKI. Multiplex immunofluorescence staining shows expression of EGFR L858R mutant protein (*red*), with adenocarcinoma features retained as evidenced by napsin (*white*), and TTF1 (*green*) expression on background of DAPI nuclear staining (*blue*). In contrast, loss of adenocarcinoma lineage markers was observed in the context of T790M-negative disease. For details, see the article by Chua and colleagues on page 5939 of this issue.
